In chemistry, regioselectivity is the preference of one direction of chemical bond making or breaking over all other possible directions. It can often apply to which of many possible positions a reagent will affect, such as which proton a strong base will abstract from an organic molecule, or where on a substituted benzene ring a further substituent will add.

The interplay of inherent electrochemistry and surface species is investigated to maximize hydrogen production on amorphous MoS<sub>2</sub> across the pH spectrum. The most active HER species are found to be the S-depleted molybdenum oxysulfide moieties, only stable in mildly acidic to neutral pHs (4 ≤ pH < 7).

Sodium triacetoxyborohydride is presented as a general reducing agent for the reductive amination of aldehydes and ketones. Procedures for using this mild and selective reagent have been developed for a wide variety of substrates.

Enantioselective synthesis, also called asymmetric synthesis, is a form of chemical synthesis. It is defined by IUPAC as: a chemical reaction (or reaction sequence) in which one or more new elements of chirality are formed in a substrate molecule and which produces the stereoisomeric (enantiomeric or diastereoisomeric) products in unequal amounts.. Put more simply: it is the synthesis of a ...

The development of visible-light-mediated allylation of unactivated sp<sup>3</sup> C-H bonds is reported. The remote allylation was directed by the amidyl radical, which was generated by photocatalytic fragmentation of a pre-functionalized amide precursor.

11 Molecular Ion Dependence on Carbon Number ∅ In Standard EI the molecular ion is reduced by ~20% per each added carbon ∅ In Cold EI it is approximately size independent ∅ The relative abundance of the molecular ion in Cold EI is significantly enhanced ∅ The enhancement is exponentially increased with the carbon number up to a factor of 2500 for C

Background. Metal-organic frameworks (MOFs) are made by linking inorganic and organic units by strong bonds (reticular synthesis). The flexibility with which the constituents'™ geometry, size, and functionality can be varied has led to more than 20,000 different MOFs being reported and studied within the past decade.

## **The Chemistry and Applications of Metal-Organic Frameworks**

The conceptual approach by which a metal-organic framework is designed and assembled is termed reticular synthesis and is based upon identification of how building blocks come together to form a net, or reticulate.

### **Metal-organic frameworks: a new class of porous materials**

1. Introduction  
1.1. Metal organic frameworks. Metal-organic frameworks (MOFs) are crystalline materials composed of metal ions (or metal clusters) and organic linkers, , , , . As a novel class of porous materials, MOFs have attracted great attention in recent years owing to their high surface area and permanent porosity.
